The present invention describes a chimeric polypeptide (A1), comprising an osteoprotegerin (OPG) dimerisation domain fused to a heterologous an osteoprotegerin (OPG) dimerisation domain fused to a heterologous comprising sequence. Also described are: (1) a multimer polypeptide comprising covalently associated A1 monomers: (2) an isolated nucleic acid acid encoding A1; (3) an expression vector comprising the nucleic acid sequence; and (4) a host cell transformed or transfected with the expression vector so that the nucleic cid is expressible. The products from the present invention are useful to treat a variety of disorders including those related to receptor binding. Compositions comprising tumour necrosis factor (TNF)/OPG and TNF receptor (TNFR)/OPG chimeras are used to treat TNF and TNFR-mediated disorders such as inflammation, autoimmune diseases and disorders related to excessive apoptosis. The fused heterologous sequences to identify potential new receptors and the present sequence represents a TNFR N-terminal peptide from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1;
                                                                                                                                                                                   Tumour necrosis factor receptor 1; TNFR-1; inhibitor; osteoprotegerin; OPG; chimeric; fusion; dimerisation domain; autoimmune disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Tumour necrosis factor receptor 1, TNFR-1; inhibitor; osteoprotegerin; OPG; chimeric; fusion; dimerisation domain; autoimmune disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New chimeric osteoprotegerin polypeptides - contain the osteoprotegerin dimerisation domain and a heterologous sequence, useful to treat TNF and TNFR-mediated disorders

The present invention describes a chimeric polypeptide (A1), comprising am osteoprotegerin (OPG) dimerisation domain fused to a heterologous amino acid sequence. Also described are: (1) a multimer polypeptide comprising covalently associated A1 monomers; (2) an isolated nucleic acid encoding A1; (3) an expression vector comprising the nucleic acid expenses and (4) a host cell transformed or transfected with the expression vector so that the nucleic acid is expressible. The products from the present invention are useful to treat a variety of disorders from the present invention are useful to treat a variety of disorders tumour necrosis factor (TNF)/OPG and TNF receptor (TNFR)/OPG chimeras are used to treat TNF and TNFR-mediated disorders such as inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    autoimmune diseases and disorders related to excessive apoptosis. The chimeras are also useful for detecting molecules which interact with fused heterologous sequences to identify potential new receptors and ligands. The present sequence represents a TNFR N-terminal peptide from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tumour necrosis factor receptor 1; TNFR-1; inhibitor; osteoprotegerin; OPG; chimeric; fusion; dimerisation domain; autoimmune disease;

                                                                                                                                                                                                      The present invention describes a chimeric polypeptide (A1), comprising an osteoprotegerin (OPG) dimerisation domain fused to a heterologous amino acid sequence. Also described are: (1) a multimer polypeptide comprising covalently associated A1 amonomers; (2) an isolated nucleic acid encoding A1; (3) an expression vector comprising the nucleic acid expenses and (4) a host cell transformed or transfected with the expression vector so that the nucleic acid is expressible. The products from the present invention are useful to treat a variety of disorders from the present invention are useful to treat a variety of disorders tumour necrosis factor (TNF)/OPG and TNF receptor (TNFN)/OPG chimeras are used to treat TNF and TNFR-mediated disorders such as inflammation,
                                                                                                                                                                                                                                                                                                                                                      autoimmune diseases and disorders related to excessive apoptosis. The otherwars are also useful for detecting molecules which interact with fused heterologous sequences to identify potential new receptors and ligands. The present sequence represents a TNFR N-terminal peptide from

The present invention describes a chimeric polypeptide (A1), comprising an osteoprotegerin (OPG) dimerisation domain fused to a heterologous an osteoprotegerin (OPG) dimerisation domain fused to a heterologous an osteoprotegerin (OPG) dimerisation domain fused to a heterologous comprising covalently associated A1 monomers; (2) an isolated nucleic acid acid encoding A1; (3) an expression vector comprising the nucleic acid sequence; and (4) a host cell transformed or transfected with the expression vector so that the nucleic acid is expressible. The products from the present invention are useful to treat a variety of disorders including those related to receptor binding. Compositions comprising tumour necrosis factor (TNF)/OPG and TNF receptor (TNFN)/OPG chimeras are used to treat TNF and disorders binding. Compositions comprising autoimmune diseases and disorders related to excessive apoptosis. The chimeras are also useful for detecting molecules which interact with fused heterologous sequences to identify potential new receptors and ligands. The present sequence represents a TNFR N-terminal peptide from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Diastereomer peptide; infection; therapy; excitatory neurotoxin; money bee venom; pardaxin; cytolytic activity; cancer; non-haemolytic; preservative; agricultural produce; bacterial cell lysis; agricultural pesticide; cell wall lysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
New chimeric osteoprotegerin polypeptides - contain the osteoprotegerin dimerisation domain and a heterologous sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5

```
increased resistance to proteolytic degradation. Non-baemolytic, cytotoxic random copolymers of pardaxin, each has a specific spectrum of activity, allowing selection of agents for particular applications. Since these random copolymers induce total lysis of bacterial cell walls, resistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a diastereomer peptide of the invention. The peptides of the invention have: (a) cytolytic activity on pathogenic cells (pathogens and malignant cells not naturally present in the body); but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse. Asthogenically the peptides, their complexes and mixtures are used to treat infections (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine. Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as agricultural pesticides. The absence of haemolytic activity (associated with disturbance of alpha-helical structures) means that the peptides have few if any toxic effects, and those that include beautiles.
                                                                                                                                                                                                                                                                                                       Peptide(s) having selective cytolytic activity - against pathogens and malignant cells, but no haemolytic activity, used for treating
                                                                                                                                                                                                                                                                                                                                                                                         Example 5; Page 47; 80pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 18;
Sequence 16, Application US/08644271

Patent No. 5814478

GENERAL INFORMATION:

APPLICANT: Valenced, et al.

TITLE OF INVENTION: NOVEL TYROSINE KINASE RECEPTORS

TITLE OF INVENTION: AND LIGANDS

NUMBER OF SEQUENCES: 32

CORRESPONDENCE ADDRESS:

ADDRESSE: Regeneron Pharmaceuticals, Inc.

STREET: 777 Old Saw Mill Road

CITY: Tarrytown
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 32; DB 2;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Title: Structure of a light-adapting hormone from the shrimp, Pandalus borealis.
A;Reference number: A01473; MUID:76253762
A;Residues: 1-18 cFER>
C;Comment: This peptide causes migration of the distal retinal pigment into the proximal the amount of light entering the retinulas.
C;Superfamily: pigment-dispersing hormone
C;Keywords: amidated carboxyl end; hormone
F;18/Modified site: amidated carboxyl end (Ala) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";
J. Protein Chem. 9:221-227(1990).
--- FUNCTION: THIS PEPTIDE BOTH INHIBITS THE ACTIVITY OF THE ANGIOTEMENIN-CONVERTING ENZYME AND ENHANCES THE ACTION OF BRADYKININ BY INHIBITING THE KINASES THAT INACTIVATE IT.

IT ACTS AS AN INDIRECT HYPOTENSIVE AGENT.
PPIR; H37196; H37196
               CONVERTING ENZYME) THEN REMOVES A DIPEPTIDE TO YIELD THE PHYSIOLOGICALLY ACTIVE PEPTIDE ANGIOTENSIN II, THE MOST POTENT PRESSOR SUBSTANCE KNOWN, WHICH HELPS REGULATE VOLUME AND MINERAL BALANCE OF BODY FLUIDS.

Insect Blochem. Mol. Biol. 26:309-317(1996).

-!- FUNCTION: INVOLVED IN THE FORMATION OF A RIGID AND INSOLUBLE EGG CHORION BY CATALYZING CHORION PROTEIN CROSSLINKING THROUGH DITYROSINE FORMATION.

-!- CATALYTIC ACTIVITY: DONOR + H(2)O(2) = OXIDIZED DONOR + 2 H(2)O.

-!- COPACYOR: BINDS HEME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -i- ENZYME REGULATION: EXTREMELY RESISTANT TO DENATURATING AGENTS, SUCH AS SDS AND ORGANIC SOLVENTS.
-i- SUBCELLULAR LOCATION: IN THE CHORION LAYER OF THE MATURE EGGS.
-i- MISCELLANEOUS: HAS HIGHEST ACTIVITY AT PH 8.0 WITH GUALACLE AS A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This claimed peptide is a cleavage recognition site for a HTLV-I protease. It is utilised as a linker between the A and B chains of a ricin-like protein in a novel recombinant protein. A nucleic acid (see AAT97910) encoding such a construct is obtained by PCR mutagenesis of the wild-type ricin linker sequence. The invention provides novel recombinant proteins which incorporate the A and B chains of a ricin-like toxin (preferably the A and B chains of a ricin-like toxin (preferably the A and B chains of cleavage recognition site for a retroviral protease such as HIV cleavage (see AAW36880-82), HTLV-I (see AAW36883-43) or HTLV-II (see Protease (see AAW36880-82), HTLV-I (see AAW36883-43) or HTLV-II (see AAW36885-65). The recombinant proteins selectively inhibit or destroy mammalian cells infected with a retroviral such as cancer cells associated with HTLV or cells associated with HTLV. The recombinant proteins are non-toxic until the ricin A chain is laberated from the B chain by a retroviral protease, and thus can be used too specifically target infected cells without the need for a cell binding component.
                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNAs encoding ricin like toxins A and B - are linked via linker containing cleavage site for retroviral protease, used to inhibit or destroy mammalian cells infected with retrovirus
                        The peptide can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 76-96 of the CD44
                                                                                                                                                                                                                                                                                                                                                                                                                    Ricin; toxin; antiviral; virucide; retrovirus; protease; HTLV-I;

This sequence represents a diastercomer peptide of the invention. The peptides of the invention have: (a) cytolytic activity on pathogenic cells (pathogens and malignant cells not naturally present in the body); but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse pathogens. The peptides, their complexes and mixtures are used to treat infections (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine. Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as preservatives for food, absence of haemolytic activity (associated with disturbance of alpha-helical structures) means that the peptides have few if any toxic effects, and those that include D-aa will have increased resistance to proteolytic degradation. Non-haemolytic, allowing selection of agents for particular applications. Since these random copolymers induce total lysis of bacterial cell walls, resistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                            /note= "D-form residue"
                                                                                                                                                                                                                                                                                                 'note= "D-form residue"

```
specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/orn D-amino acid residues and comprises an alpha-halix breaker moiety, or a peptide (or cyclic derivative of this) which (comprises L-amino acid residues and D-amino acid residues, has a net
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens. Including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be used as disinfectants for destruction of microorganisms, i.e. in solutions for wetting contact lenses, as preservatives, e.g., in the bactericides or for preservation of agricultural products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           present peptide is used to produce the agents of the invention. The

```
The sequence is a specific example of a group of new immunogenic peptides having an HLA-A3.2, HLA-A1, HLA-A11 or HLA-A24.1 binding motif. For example, the peptides having an HLA-A3.2 binding motif each have 9-10 residues and contain, from the N-terminus to the C-terminus, (a) a first conserved residue selected from L, M, I, V, S, Y, T, F, C, G, D and E and (b) a second conserved residue of K, R, Y, H or F, where the first and second conserved residue of separated by 6-7 residues. The peptides are capable of binding selected MHC molecules and inducing an immune response. They can be used to treat and/or prevent viral infection and cancer, e.g. prostate cancer, lymphoma, hepatitis or AIDS. They can also be used to produce antibodies for use as diagnostic or therapeutic agents. The peptides can also be used as diagnostic agents.
                                                                                                                                                                                                                                              Immunogen; HLA; human leukocyte antigen; binding motif; antiviral; MHC; major histocompatability complex; viral infection; anticancer; prostate cancer; lymphoma; hepatitis; AIDS; diagnostic; diagnosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              XXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(Li)C-F1, -(Li)C-F1-(L2)d-P2.

(Li)c-P1-(L2)d-P2-(L3)e-P^3, or -(Li)C-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; Li, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and b, c, d, e, and f = are each independently linkers; and b, b. c, d, e, and f = are each independently linkers; and b, b. c, d, e, and f = are each independently linkers; and bost colls from the present invention can have cytostatic, antiasthmatic, thrombollytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention are useful for treating cancer, asthma, thrombosis, or autoimmune diseases.

The use of an FC domain (rather than a Fab domain) can provide a longer while of the present incorporate functions such as FC receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 condences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ANY ANY 45390 to ANY 48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukcoyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CC HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell cresponse against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound commandly induced by an antigen in the form of a peptide fragment bound are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) corporate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or individuals susceptible or otherwise at risk of viral infection or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
                 Immunogenic peptide having a human leukocyte antigen binding motif #343

peptides, which interact with proteoglycan NG2. The invention includes a method for trargeting anglogenic vasculature in a tumour in vivo, and a method for inhibiting anglogenesis in a tumour comprising administering one of the anglogenic vasculature homing peptides linked to a moiety such as a drug or cytotoxic agent. The peptides exhibit cytostatic activity, and are used for targeting drugs, cytotoxic agents or chemotherapeutic agents to tumours or tissues or other organs associated with anglogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

pollinosis

Sequence

```
AAR97871-R97960 are overlapping peptides used for the epitope mapping of the Japan cedar pollen allergen Cry j II. Cry j II and allergenic peptides of it are useful in the diagnosis, prevention and treatment of Sugi pollinosis, the allergic reaction to Japan cedar pollen. Significant regions of the allergic were identified using the overlapping peptides of the full epitope derived from a Cry j II antigen-specific T cell line. Anino acids 66-80 (AAR97884) and 186-200 (R978908) of the full mature 460 amino acid allergen are the most

Cry j II and allergenic peptides of it are useful in the diagnosis, prevention and treatment of Sugi pollinosis, the allergic reaction to Japan cedar pollen. Significant regions of the allergen were identified using the overlapping peptides of the full epitope derived from a Cry j II antigen-specific T cell line. Amino acids 66-80 (AAR97884) and 186-200 (R978908) of the full mature 460 maino acid allergen are the most
                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                           The sequence is of a Japanese cedar pollen allergen Cry j IIA fragment. The protein and fragments can be used for diagnosis and treatment of Japanese cedar pollinosis and to identify similar sequences in other plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Japan cedar pollen allergen Cry j II epitope – comprises at least part of specified 460 amino acid protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Japan cedar pollen mature allergen Cry j II amino acids 356-370.

The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs
                                                                                                                                                                                                                                                                                                                                                                   can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Note: The sequence data for this patent did not form part of the printer specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide #6043 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                         analyzing gene expression in human cervical epithelial cells
                                                                                                                                                                                                                          Human genome-derived single exon nucleic acid probes useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 30; DB 22; Length 16

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    angiogenesis-inducing stimulus by administering an agent (1) that modulates a leptin, or leptin receptor, mediated angiogenic response to that stimulus. The method may be used to treat diseases controlled by angiogenesis including wound healing, tumours and tumour metastasis, diabetic microangiopathy, retinal neovascularisation, neovascularisation of adipose tissue and fat metabolism, revascularisation of necrotic tissue, enhancement or vascularisation in microvascular transplants and ovarian follicle maturation. The present sequence represents a peptide based on the human leptin receptor, given in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     method has been developed for modulating a response in a subject to an

                                                                                                                        The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 14, Application US/07854603
Patent No. 5637492
GENERAL INFORMATION:
APPLICANT: Dawson, Keith M
APPLICANT: Edwards, Richard M
APPLICANT: Edwards, Richard M
TITLE OF INVENTION: Activatable fibrinolytic and
TITLE OF INVENTION: anti-thrombotic proteins
NUMBER OF SEQUENCES: 40
CORRESPONDENCE ADDRESSE:
ADDRESSEE: Dr. John J. McDonnel
STREET: Ten South Wacker Drive, Suite 3000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           COMPUTER READABLE FORM:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
